

FaSP Coding Scheme

The following codes were applied to the results statements for each report included in the sample. All relevant codes were assigned to each result statement. Atlas.ti software supported the coding process.

CODES (Each result statement may be coded with more than one FAMILY, PARENT, and/ or CONDITION code)	DEFINITION & SOURCE
FAMILY SYSTEM CODES	
Family Structure	Results statements about family composition and the ordered roles and relationships within the family, including routines and rituals of everyday family life, division of labor in general, not condition-focused
Family Functioning	Results statements about characteristics of the family system (e.g., resilience, cohesiveness, environment, climate, values, family system stress). Results statements about the focus of interactions among family members (e.g., decision making, problem solving, information sharing, communication). Mealtime interactions related to child's food consumption.
Family Relationships	Results statements about the nature, quality, correlates and predictors of relationships among family members (e.g., marital adjustment, conflict and conflict resolution, withdrawal, attachment, relationship satisfaction). Results statements about family members' views of each other; does not include extended family
Family Resources	Results statements about factors external to the family that contribute to the quality of family life, the child's life, or family member response including all types and sources of social support, child care, home and neighborhood environment; relocation for needed services; support from health care providers; support from religion; camp . Includes extended family.
PARENT AND CHILD CODES – Codes refer to content of result statement and not family member providing data	
Parent Experience	Results statements about what it is like to be the parent of a child with a chronic condition, how parents occupy their time, and what coping processes they use.
Parent View of Child Identity	Results statements about parents' views of the child and his/her capabilities, vulnerabilities, and overall view of child identity
Parent Wellbeing	Results statements about the relationship between a child, parent, or family factor, and the nature and quality of parent wellbeing, including parenting stress, parent physical health, psychosocial functioning, coping as an outcome, and mother-father comparisons

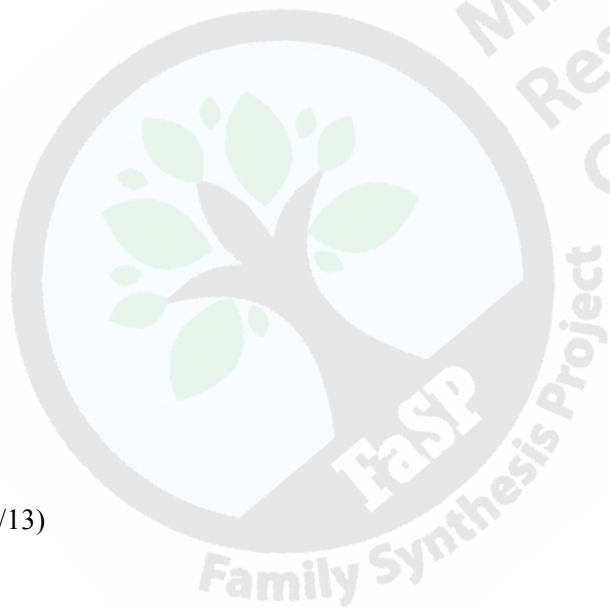

Parent Role Performance	Results statements about the nature and quality of parenting, including parental competence, parenting style, mothering versus fathering comparisons, parenting related to the child's performance of condition management. Results statements about the relationship between a child, parent, family factor or condition characteristic, and parent role performance.
Child Wellbeing	Results statements about the relationship between some parent or family factor and the nature and quality of child wellbeing, including child behavior, psychosocial functioning, physical health and functioning, and academic performance.
Sibling Wellbeing	Results statements about the relationship between some parent or family factor and the nature and quality of sibling wellbeing, including sibling behavior and psychosocial functioning and physical health and functioning
CONDITION & DEMOGRAPHIC CODES	
Condition Management	Results statements focused on what families and family members do to manage the condition, its demands, and treatments including adherence, monitoring, advance planning, tricks of the trade, division of labor, orchestrating others' involvement in condition management, incorporating management into family life.
Condition Characteristics	Results statements about qualities of the condition that are independent from family members' perceptions – genetic basis, life shortening, curable versus non-curable, condition duration. Does not apply to transient changes in the condition. Use when coding across condition comparisons or between well children and those with the condition.
Condition Perceptions	Results statements about child or family members' perceptions of, beliefs about, and meanings attributed to the condition and its treatment, including causation/ etiology, trajectory, seriousness, controllability, visibility, intrusiveness; nature of family discourse about the condition; acceptability and effectiveness of treatment. Does not apply to transient changes in the condition.
Diagnosis	Results statements that describe, explain, or predict some aspect of the child's, parent's or family's experience of coming to know the child's diagnosis; results focusing on the time period surrounding the diagnosis. Cross code with other relevant categories (e.g., parent experience)
Demographics	Results statements that link age, gender, ethnicity, education, SES, and/or employment to family, parent, child, or condition factors. Do not code when the demographic variable is a control variable. Smokers vs. non-smokers in household for asthma sample.

INTERVENTION OUTCOME CODES -- Codes refer to nature of intervention effect and not family member providing data

Child Behavior and Psychosocial Functioning	Results statements reporting intervention effects on nature and quality of child behavior and functioning, including problem behaviors, social competence, self-perception, psychosocial functioning, school attendance and performance, social activity limitation.
Child Physical Health and Functioning	Results statements reporting intervention effects on child's health status, including condition severity, physical activity limitations, physical functioning, symptoms
Child Perception of Condition & Treatments	Results statements focused on intervention effects on child's perceptions of, beliefs about, and meanings attributed to the condition and its treatment, including condition causation/ etiology, trajectory, seriousness, controllability, visibility, intrusiveness, and treatment effectiveness and acceptability
Child Condition Management	Results statements reporting intervention effects on child's ability to manage the condition and treatments, including adherence, skill, knowledge, seeking help and input, and self-efficacy.
Parent Condition Management	Results statements reporting intervention effects on parent's ability to manage the condition and treatments, including adherence, skill, knowledge, and self-efficacy
Parent Role Performance	Results statements reporting intervention effects on the nature and quality of parenting, including parental competence, parenting style, parenting confidence with respect to general parenting (i.e., discipline) and not in relation to condition management
Parent Wellbeing	Results statements reporting intervention effects on the nature and quality of parent wellbeing, including parenting stress, parent physical health, psychosocial functioning
Parent Perception of Condition & Treatments	Results statements reporting intervention effects parents' perceptions of, beliefs about, and meanings attributed to the condition and its treatment, including condition causation/ etiology, trajectory, seriousness, controllability, visibility, intrusiveness; and treatment effectiveness and acceptability.
Family Structure	Results statements reporting intervention effects on ordered roles and relationships within the family, including routines and rituals of everyday family life, division of labor both in general and condition-focused.
Family Functioning	Results statements reporting intervention effects on characteristics of the family system (e.g., change/no change in resilience, cohesiveness, environment, climate, values, adaptability). Results statements reporting intervention effects on the nature of interactions among family members in major areas of family life (e.g., change/no change in decision making, problem solving, information sharing).
Family Relationships	Results statements reporting intervention effects on the nature and quality of relationships among individual family members (e.g., change/no change in marital adjustment, conflict and conflict resolution, withdrawal, attachment, relationship satisfaction). Results statements reporting intervention effects on family members' views of each other (e.g., perceived child vulnerability or partner self-efficacy to manage condition, child perception of parent support)

Sibling Behavior and Psychosocial Functioning

Results statements reporting intervention effects on the nature and quality of sibling behavior and functioning and functioning, including problem behaviors, social competence, self-perception, psychosocial functioning, and school attendance and performance.
